ferti-lome Indoor\Outdoor insect spray

Contains: Micro-emulsified Permethrin

Bedbugs: Spray mattresses, particularly around tufts and seams. Take beds apart and spray into all joints. Treat baseboards, moldings and floors. Allow all sprayed articles to dry thoroughly before reuse. After mattress is dry, cover with mattress cover and sheet. Do not use mattress without cover. Repeat treatment once a month.

Natural Guard Crawling Insect Control

Contains: Diatomaceous Earth

Bedbugs: Dismantle bed. Use Crawling Insect Control in joints, crevices and where rungs are inserted. See that all interior areas are dusted. Dust mattresses especially folds and edges. All cracks and crevices in the bedroom should be treated.

At the beginning of an infestation in a room, bedbugs are likely to be found only about the tufts, seams, folds of mattresses and covers; later they spread to crevices in the bed and bedroom. To control bedbugs, locate their hiding places, see photo below. Spray or dust beds (slats, springs and frame) and other hiding places about the room. Because it is impossible to penetrate all hiding places, control is usually not immediate. A few living bugs may be seen for a week to 10 days after application. After 10 days, a second application, equal to the first is necessary to kill the just hatching nymphs. Due to a short residual life this second application is always needed.
