

Regency Feeds

Prince Corporation has been manufacturing llama feed for many years. Llamas and other camelids, although not native to Native America, can and do adapt very well to our environment. However, since their digestive tracts are designed around the consumption of forages in a vastly different environment, we must adjust our feeds and feeding schemes to meet their specific needs.

Multiple Protein Sources

Although llamas are not ruminants, their digestive tract is similar with a fore-stomach for fermentation of forages. Prince Llama Feeds provide protein for both support of the animal and support of the important fermenting bacteria.

Locked Formulas

Prince does not vary its formulations based on least cost formulation. Beyond that, we only purchase ingredients from sources with a history of providing consistent high quality products. By providing consistent high quality feed ingredients we encourage good feed consumption and steady production.

Manufacturing Technique

Prince operates its' pelleting equipment at temperatures that have been shown to maximize digestibility of pellets and crumbles versus those products manufactured at either cooler or warmer temperatures.

Fun Fact:

The llama can spit a distance of 10 feet or more to tell other llamas to stay away.
