FUNGUS IS HERE!!

All indications are that the summer of 2011 is going to be one very intense fungus season. The unusually cool weather and excessive amounts of rain has enabled lawns to stay ahead of the fungus infestations for now. But when it gets hot and drier, LOOK OUT!

If your lawn has a fungus history, it is a good idea to apply a fungicide as soon as possible to inhibit the inevitable spread of fungus through your lawn. A preventative application will help the appearance of your lawn through the summer. Once the fungus hits, you will have to apply more product and your lawn probably won't look as good as you'd like until the cooler weather of autumn arrives.

THINGS TO LOOK FOR

1) Do you have "spider webs" on your lawn early in the morning?

IT'S NOT SPIDERS - IT'S MYCELIA!

Some of the most damaging lawn fungi spread by travelling spot to spot via Mycelia, which looks like "spider webs" on your lawn. This can be seen early in the day, but melts away in the late morning hours.

2) Does your lawn have a hazy look in spots?

Check those spots looking for lesions on individual plants. If lesions are present, they are going to spread.
